1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-10 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Pat. No. 5077339 Grogler et al. in view of US Pat. No. 4647646 Hardy et al..

Grogler discloses the instantly claimed hot melt adhesive with the exception of the instantly claimed amount of blocked isocyanate groups. It is noted that the polyester therein has a melting point which indicates crystallinity by definition of melting point. It is also noted that polymers always have some degree of amorphous character and therefore the polyester polyol of the patentee falls within the scope of each of the instantly claimed components 1 and 2. Grogler discloses the polyethers at column 5, line 58 to column 6, line 3. The instantly claimed component B is disclosed at column 6, lines 20-68. The instantly claimed prepolymer molecular weight is encompassed by the reactant molecular weights and reaction conditions used to make the prepolymer. The patentee does not disclose the instantly claimed blocking of the NCO groups nor the amount of blocking of NCO groups. It would have been obvious to one of ordinary skill in the art at the time of the instant invention to use the instantly claimed prepolymer molecular weight because it would give only predictable properties, such as viscosity and modulus as is taught in polymer texts, and is encompassed by the patentee as stated above. It would have been

obvious to one of ordinary skill in the art at the time of the instant invention to block the NCO groups of Grogler with the instantly claimed amount of blocking agent because Grogler clearly desires to "deactivate" the NCO groups of their polymer and Hardy shows blocking them with the instantly claimed amount of blocking agent to give such "deactivation". Thus, the use of the instantly claimed amount of blocking agent in the adhesive of Grogler would give a result desired by them as is clearly predictable and known to the ordinary skilled artisan. See Hardy, column 4, lines 10-17.
